

Project Title

AUTOMATED NETWORK REQUEST MANAGEMENT SYSTEM

Name : Avala Praveena

College : Sri Vasavi Engineering College

Email : 23A81A0571@sves.org.in

PROJECT OVERVIEW

The **Automated Network Request Management in ServiceNow** project focuses on simplifying and accelerating the handling of network-related service requests. The solution uses ServiceNow's **Service Catalog, custom tables, UI Policies, Catalog Client Scripts, Flow Designer, approval actions, and email notifications** to automate the request management process.

End users can submit network requests through a self-service catalog form. The system captures the required requester and network-related information, validates the submitted data, and stores the request details in a structured custom table. After submission, the request is processed through an automated approval flow. Based on the approval result, the request record is updated and appropriate email notifications are generated.

By reducing manual processing and providing a structured request and approval workflow, the system improves transparency, consistency, and efficiency in network request management.

1. INTRODUCTION

Modern enterprises rely heavily on reliable network services to support their day-to-day operations. As organizations grow, the number of network-related service requests also

increases. These requests may include connectivity requirements, existing network service changes, and other network support activities.

Traditional manual request handling can result in delays, incomplete information, repeated communication, and limited visibility into request status. To address these challenges, the **Automated Network Request Management System** provides a structured and automated approach using the ServiceNow platform.

The system allows end users to submit requests through a ServiceNow Service Catalog form. The submitted information is captured through catalog variables and stored in a custom **Database Tables** table. ServiceNow **Flow Designer** is then used to automate record creation, approval processing, status updates, and email notifications.

The solution provides a complete request lifecycle from **request submission to approval and notification**, while reducing repetitive administrative activities and improving transparency for both requesters and IT teams.

2. PROJECT OBJECTIVES

The primary objective of this project is to design and implement an automated solution for managing network-related service requests within ServiceNow.

The major objectives are:

- To provide a user-friendly ServiceNow Service Catalog for submitting network requests.
- To capture requester and network-related information through structured catalog variables.
- To reduce incomplete submissions through appropriate field validation.
- To automatically populate relevant requester information where applicable.
- To store submitted request information in a structured custom table.
- To automate the approval process using ServiceNow Flow Designer.
- To update request records according to the approval outcome.
- To send automated email notifications during the request lifecycle.
- To provide better visibility and traceability of requests.
- To implement appropriate access controls for the custom application data.
- To test the complete request, approval, and notification lifecycle.

3. KEY FEATURES

The major features implemented in the project include:

3.1 Service Catalog

A custom **Network Request** catalog item is provided through the ServiceNow Service Portal. Users can submit their network-related requirements through a structured form.

3.2 Requester Information

The **Requester Information** variable set captures relevant requester details such as user information, email, and phone number.

3.3 Dynamic Form Behaviour

UI Policies and Catalog Client Scripts are used where required to control form behaviour and dynamically handle information displayed or populated on the catalog form.

3.4 Field Validation

Important fields can be configured as mandatory to reduce incomplete request submissions and maintain data quality.

3.5 Custom Database Table

Submitted catalog information is mapped to the custom **Database Tables** table (u_database_tables) for structured storage and further processing.

3.6 Automated Flow

ServiceNow **Flow Designer** automates the request lifecycle. The flow retrieves catalog variables, creates a custom table record, sends notifications, requests approval, evaluates the approval result, and updates the request accordingly.

3.7 Approval Workflow

The system includes an approval stage before the request can proceed to the next stage of processing. The approval outcome is evaluated by the flow.

3.8 Email Notifications

Automated email notifications are used to communicate important request events, such as request creation and approval-related updates.

3.9 Access Control

Access Control Lists (ACLs) are configured for the custom table to control operations such as create, read, write, and delete according to the configured roles.

3.10 Request Tracking

The custom table stores request information and approval status, allowing administrators and authorized users to track the progress of submitted requests.

4. SERVICENOW DEVELOPER SETUP

The project was developed and tested using a **ServiceNow Personal Developer Instance (PDI)**.

The development environment was used to configure:

- Service Catalog
- Catalog Variables

- Variable Sets
- UI Policies
- Catalog Client Scripts
- Custom Tables
- Access Control Lists
- Flow Designer
- Approval Actions
- Email Notifications
- Service Portal

The project was implemented within the ServiceNow development environment and tested using sample request submissions.

5. PROJECT IMPLEMENTATION IN SERVICENOW

The implementation was carried out in multiple stages:

Phase 1 – Catalog Creation

A Service Catalog item named **Network Request** was created to allow users to submit network-related requests.

Phase 2 – Form Configuration

Catalog variables were configured to collect the required request information, including:

- Requested For
- Mobile Number
- Type of Connection
- Existing ID
- Total Amount
- Mode of Payment
- Address

A **Requester Information** variable set was also configured for requester-related information.

Phase 3 – Custom Table

A custom table named **Database Tables** was created to store the submitted request information.

The table contains fields for important request information such as:

- Database Number

- Requested For
- Mobile Number
- Type of Connection
- Existing ID
- Total Amount
- Mode of Payment
- Address
- Approval Status
- Assigned To

Phase 4 – Flow Designer

A Flow Designer flow named **Network Request** was configured to automate the request lifecycle.

The flow performs the following major operations:

Service Catalog Request → Get Catalog Variables → Create Database Tables Record → Send Email → Ask for Approval → Check Approval Result → Update Record

Phase 5 – Testing

The complete workflow was tested using sample catalog submissions. Request creation, record generation, approval processing, email notification, and request status updates were verified.

IMPLEMENTATION

Phase:2

Step:1.1 Table Creation

Navigate to: System Definition > **Tables**.

Click **New** to create a new table.

Fill in Table Information:

Label: Database Tables

Name: u_database_tables

Click **Submit** to create the table.

Step:1.2 Create Fields in Database Table

Navigate to **All → System Definition → Tables**.

Search for **Database Tables** in the table list.

Open the **Database Tables** table.

Create fields using **Insert new record** at table columns

Create required fields which are shown in the img

Verify the newly created fields by opening a **Database tables** records.

The screenshot shows the ServiceNow 'Table - Database Tables' configuration page. The 'Columns' tab is active, displaying a list of 15 columns. The columns are:

Column label	Type	Reference	Max length	Default value	Display
Mode of Payment	String	(empty)	40		false
Created	Date/Time	(empty)	40		false
Assignment to	Reference	User	32		false
Requested For	String	(empty)	40		false
Updates	Integer	(empty)	40		false
Mobile number	String	(empty)	40		false
Updated by	String	(empty)	40		false
Type of Connection	String	(empty)	40		false
Updated	Date/Time	(empty)	40		false
Database Number	String	(empty)	40		false
Total Amount	String	(empty)	40		false
Created by	String	(empty)	40		false
Approval Status	String	(empty)	40		false
Customer Address	String	(empty)	40		false
Sys ID	Sys ID (GUID)	(empty)	32		false

Step: 2.1 Creation of Approval Request on Network Database Table

Activity 1: Creation of Related List

Navigate to **System Definition > Relationships**.

Click **New** to create a new relationship.

Fill in the following details:

Name: Approval Request

Applies to Table : Database table

Queries from Table : sysapprovals table.

Active: Make sure it's set to **True**.

Save the relationship.

Relationship - Approval Request ☆ Application scope: Global Update set: Default [Global]

Name: Application:

Advanced: ☐ Applies to table: Queries from table:

This script refines the query in current that will populate the related list. For more information about it, its parameters and control variables, see [the documentation](#) See also the article about the [recommended form of the script](#).

Query with Turn on ECMAScript 2021 (ES12) mode

```

1 (function refineQuery(current, parent) {
2
3     // Add your code here, such as current.addQuery(field, value);
4     current.addQuery('source_table', parent.getTableName());
5     current.addQuery('document_id', parent.sys_id);
6
7 })(current, parent);

```

Activity 2: Adding Related List to the Table

Through tables->Database tables -> in related links **click Show List -> create new ->fill the fields as shown in fig .**

Now open that just now created record.

Add a **Related List** widget to the form.

Select the **Related List** you want to show

Database Tables - Created 2026-09-... ☆ Application scope: Global Update set: Default [Global]

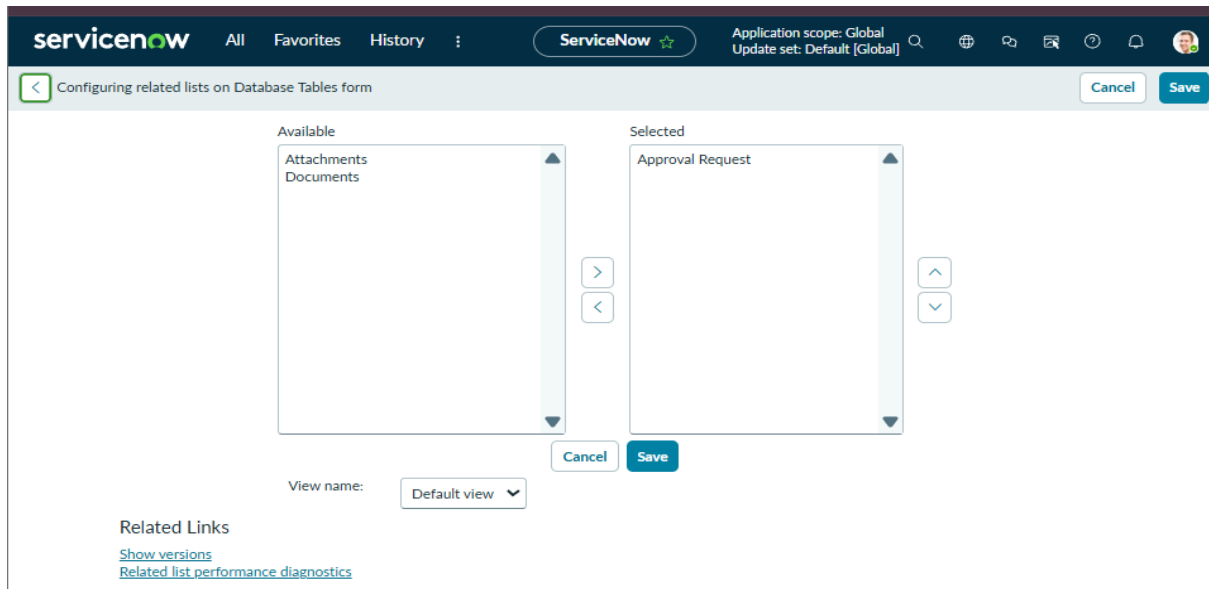

Database Number: Assignment to: Mobile Number: Type of Connection: Total Amount:

Configuration menu options: Save, Insert, Insert and Stay, Analyze Access, **Configure**, Export, View, Create Favorite, Copy URL, Copy sys_id, Show XML, History, Reload form.

Related Lists menu options: All, Table, Security Rules, Business Rules, Client Scripts, UI Policies, Data Policies, UI Actions, Notifications, Dictionary.

Phase-3

Interface Design

Activity 1: Creation of Service Catalog

medium

Description

Navigate to Application navigator

Click on All >> search for Service Catalog

Under Service Catalog>> Maintain items

Click on New

Fill the details >> Name– Network Request

Select Catalog>> Service Catalog

Select Category>> Networks and Connectivity / Network Standard changes

Fill the Short Description as Network request Management

Click on Save.

Catalog Item
Network Request

Build and modify items faster with the improved [Catalog Builder](#).

Catalog Items are goods or services available to order from the service catalog. Items can be anything from hardware, like tablets and phones, to software applications, to furniture and office supplies.

- Enter a Name and Short description to display for the item.
- Enter a Price, approvals, variables, and other information as needed.

Name: Network Request

Disable automatic slot fill based on user context: ☐

Question | Annotation | Type Specifications | Default Value | Auto-populate | Permission | Availability

Specify the **Question** that explains the options available to the end user when ordering the item

* Question: Email ID

* Name: email_id

Conversational label:

Tooltip: Email ID of the selected user

Example Text: Automatically populated

Question | Annotation | Type Specifications | Default Value | **Auto-populate** | Permission | Availability

Dependent question: Opened on behalf of

Reference: User [sys_user]

Dot walk path: Email

Note: Follow the same procedure to auto populate values for all other variables

Step :3.3 UI Policy

Procedure

Navigate to **Maintain Items**

Open **Network Request** item

In related list, we have Catalog UI policy

Click on New button to configure New UI policy

Select Applies to as Catalog item

Select catalog item as Network Request

Provide short description, if required

Apply condition>> **types of Connection** is **Existing**

Click on save, after saving the form will get UI policy actions in the related list

Click on New button to configure new UI Policy action, and select the variable which we want to display on condition

Make Visible True as per our requirement

Update the UI Policy and Test the same on Catalog form.
